Accumulator shut-off block

Type ABZSS

HAD8066

- ▶ Nominal diameter DN08; DN10; DN20; DN30
- ▶ Component series 3X
- ▶ Maximum operating pressure 350 bar [5075 psi]

Connection thread

14	Further details in the plain text	
----	-----------------------------------	--

1) "DN30" only

2) Not with "DN08"

3) Type SO30 is supplied with a pressure rating of 315 bar [4570 psi]

4) According to the Pressure Equipment Directive 2014/68/EU

5) Only with electro-magnetic unloading design "E" or electro-magnetic pressure holding design "C"

6) Mating connectors, separate order, see page 16 and data sheet 08006.

7) Special version

8) For the connection to the AC voltage mains, a DC solenoid which is controlled by a rectifier is to be used (see table on the right). For individual connection, a large mating connector with integrated rectifier can be used (separate order, see page 16).

9) Manual accumulator discharge only, seal material "V" only. Assembly free from aluminum, without electrically operated components, housing electroplated FE//Zn8//Cn//T0 according to ISO 19598

AC voltage mains (admissible voltage tolerance $\pm 10\%$)	Nominal voltage of the DC solenoid in case of operation with alternating voltage	Ordering code
110 V - 50/60 Hz 120 V - 60 Hz	96 V	G96
230 V - 50/60Hz	205 V	G205

 **Notice:** Unlike the ABZSS30 standard accumulator safety block, the ABZSS30 ...SO30 is equipped with a direct operated pressure relief valve NG30. Version ABZSS-P30 for subplate mounting.

5	Electro-magnetic unloading, normally closed, optional

Function

The accumulator shut-off block serves for the protection, isolation and unloading of hydraulic accumulators. It is classified based on its use according to the Pressure Equipment Directive 2014/68/EU article 4, section 3. The connection between the accumulator shut-off block and the accumulator is realized by means of an accumula-

tor adapter.

The accumulator is protected from inadmissible overpressure by means of the pressure relief valve. The **pressure relief valve** must **not be used for any control tasks**. Sufficient difference between the maximum operating pressure and the working pressure must be ensured. Response of the pressure relief valve should be prevented, if possible.

Preferred types

Important notices on hydraulic fluids:

- ▶ For more information and data on the use of other hydraulic fluids, please refer to the data sheets above or contact us.
- ▶ There may be limitations regarding the technical valve data

(temperature, pressure range, life cycle, maintenance intervals, etc.).

- ▶ The ignition temperature of the hydraulic fluid used must be 40 K higher than the maximum solenoid surface temperature.

electrical	
Protection class according to DIN EN 60529	▶ With connector "K4" IP 65 (with mating connector mounted and locked)

1) Special version

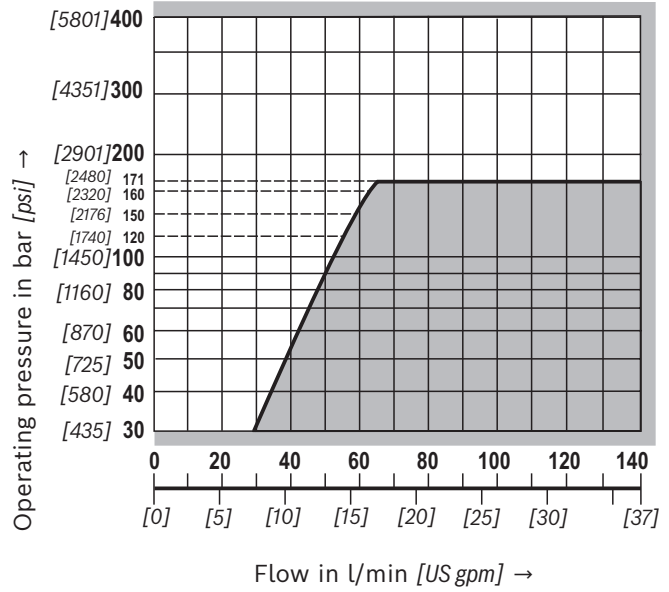

2) The cleanliness classes specified for the components must be adhered to in hydraulic systems. Effective filtration prevents faults and simultaneously increases the life cycle of the components.

Characteristic curves: Type-examination tested safety valves type DBD 1)

²⁾ Special version

Safety instructions: Type-examination tested safety valves type DBDS ¹⁾

- ▶ Before ordering a type-examination tested safety valve, ensure that for the desired **response pressure p** , the maximum admissible **flow q_{Vmax}** of the safety valve is larger than the maximum possible flow of the system/accumulator to be secured.
According to the Pressure Equipment Directive **2014/68/EU**, the increase in the system pressure due to the flow must not exceed 10% of the set response pressure (see component marking).
 - ▶ The maximum admissible flow q_{Vmax} stated in the component marking must not be exceeded.
 - ▶ Discharge lines of safety valves must end in a risk-free manner. An accumulation of fluids in the discharge system must **not** be possible (see data sheet AD2000 A2).
-  **It is imperative to observe the application notes!**
- ▶ In the plant, the response pressure specified in the component marking is set at a flow of 2 l/min [0.53 US gpm].
 - ▶ The maximum flow stated in the component marking applies for applications without counter pressure in the discharge line (port T).
- ▶ By removing the lead seal at the safety valve, the approval according to the Pressure Equipment Directive becomes void!
 - ▶ Basically, the requirements of the Pressure Equipment Directive and of data sheet AD 2000 A2 have to be observed!
 - ▶ It is recommended to secure type-examination tested safety valves against inadmissible disassembly by wiring and sealing them with the housing/block (bore available in the adjustment type).

 **Notice:**

The system pressure increases by the counter pressure in the discharge line (port T) due to the increasing flow. (Observe the data sheet AD 2000 A 2, point 6.3!)

To ensure that this increase in system pressure caused by the flow does not exceed 10% of the set response pressure, the admissible flow has to be reduced dependent on the counter pressure in the discharge line (port T) (see diagrams on page 22 ... 25).

¹⁾ Component series 1X according to the Pressure Equipment Directive 2014/68/EU

Characteristic curves: Counter pressure in the discharge line

In principle, the valve should be operated without counter pressure in the discharge line, if possible. In case of counter pressure in the discharge line, the maximum possible flow is reduced. There is a relationship between maximum counter pressure p_T in the discharge line and flow q_v , which can be seen from the following characteristic curve. Characteristic curves for intermediate values of the response pressure which are not listed must be determined by means of interpolation.

When the flow approaches zero, the maximum counter pressure p_T is in each case 10% of the response pressure. With increasing flow, the maximum counter pressure p_T decreases.

Interpolation of intermediate values from the diagram

1. At the axis p_T , mark 1/10 of the value of p_A .
2. Determine the next lower and the next higher characteristic curve for this point. The point marked at p_T divides the section between lower and higher characteristic curve on the p_T axis with a certain percentage.
3. At the q_{Vmax} axis, divide the section between next lower and next higher characteristic curve in the same percentage as the section at the p_T axis. From the zero position flow on the q_{Vmax} axis determined in that way, draw a straight line to the value on the p_T axis marked before.
4. Mark the system flow to be secured at the q_{Vmax} axis.
5. Read off the maximum counter pressure for this value using the line at the p_T axis drawn before.

Characteristic curves: Counter pressure in the discharge line – size 6

Diagram for determining the maximum counter pressure p_T in the discharge line at port T of the valve dependent on the flow q_{Vmax} for valves DBDS 6...1X/...E with different response pressures p_A .

Characteristic curves	Response pressure p_A in bar [psi]
1	30 [435]
2	60 [870]
3	110 [1595]
4	115 [1668]
5	170 [2465]
6	210 [3046]
7	315 [4568]
8	400 [5800]

Characteristic curves for intermediate values can be generated by interpolation. Further explanations can be found on page 21.

- p_A Response pressure in bar
- p_T Maximum counter pressure in the discharge line (port T) in bar
- q_{Vmax} Maximum flow in l/min
- I** Interpolation area I, for valves with $p_A = 30 \dots 110$ bar and $q_{Vmax} = 14 \dots 27$ l/min
- II** Interpolation area II, for valves with $p_A = 115 \dots 400$ bar and $q_{Vmax} = 52$ l/min

Determination of the maximum counter pressure

Example 1 (with already existing characteristic curve):
 Flow of the system / accumulator to be secured: $q_{Vmax} = 15$ l/min
 Safety valve set to: $p_A = 315$ bar.
 Read off the maximum counter pressure p_T of approx. 22.5 bar from the diagram (see arrows, characteristic curve 7).

Example 2 (with interpolated characteristic curve):
 Flow of the system / accumulator to be secured: $q_{Vmax} = 15$ l/min
 Safety valve set to: $p_A = 80$ bar.
 Value to be marked at the axis referred to as p_T :
 $1/10 \times 80$ bar = 8 bar.
 Read off the maximum counter pressure p_T of approx. 3 bar from the diagram (see arrows, dashed characteristic curve).

Characteristic curves: Counter pressure in the discharge line – size 10

Diagram for determining the maximum counter pressure p_T in the discharge line at port T of the valve dependent on the flow q_{Vmax} for valves DBDS 10...1X/...E with different response pressures p_A .

Characteristic curves for intermediate values can be generated by interpolation. Further explanations can be found on page 21.

- p_A Response pressure in bar
- p_T Maximum counter pressure in the discharge line (port T) in bar
- q_{Vmax} Maximum flow in l/min
